

- Suppose you want to
- 1) Define a structure in C and C++  
This structure should hold the variables for student type. Compute the size of the structure manually.

Source Code:-

```
#include <iostream>
using namespace std;
struct Student
{
    int Rollno;
    char name[20];
    char h;
    float marks;
};

int main()
{
    cout << "size of structure" <<
        sizeof(Student);
    return 0;
}
```

O/P :- size of structure : 32
